

Important Notice

The integrated **Calout Oven Protection System** on this combination oven has been designed and tested to protect your product from calcium and other water impurities which are found in many water supplies. Using it as recommended will help to ensure that your oven is kept in optimum condition and give you many years of trouble free operation.

The **Calout Oven Protection System** is operational for areas with water hardness levels of up to 14°dH. For those areas with water hardness levels greater than this it is required that a water softener is installed to bring the level below 14°dH. We strongly recommend that the **Calout Oven Protection System** is used on all ovens but if your water hardness levels are less than 14°dH it will be your choice whether or not to retain the **Calout Oven Protection System** or use an alternative means of water treatment.

By turning off the **Calout Oven Protection System**, you as the owner /operator run the risk of damaging the unit so it may not perform to its design specification or end user expectation and may even be damaged beyond economical repair.

Falcon and all companies associated to it will not be liable for any claim for damage or fitness for use as a result of turning off the Calout Oven Protection System and introducing calcium scale into the combination oven.

Should you choose to switch the **Calout Oven Protection System** please contact us as below and we will arrange for this to happen. This will be carried out by Falcon approved personnel and will be documented against the oven's service record.
